

# The project team

## Environment Agency

As a main river, the Environment Agency are the lead authority along the Fowlea Brook and have powers to maintain it. However, as we are not the landowners we have to work with the landowners to ensure we deliver a suitable solution to the flood risk. Importantly this includes a forward look at future maintenance and who would be responsible for that maintenance. It is our responsibility to make sure that the scheme delivers best value for the tax payer, that it is compliant with environmental legislation, that funding is secured and that the implications of future climate change are factored into the design of the scheme.

## Arup supported by Jacobs

Arup is providing Civil Engineering input including providing specialist knowledge in structures, ground engineering, ecology and heritage to inform the design of the proposed scheme.

Jacobs are supporting Arup to assist in assessing, modelling and delivering flood risk management schemes in the Midlands.

## Jackson Civil Engineering

Jackson are a UK based civil engineering firm who will be responsible for carrying out physical investigations and constructing the defence. Their input throughout the process informs the scheme costing and construction method for the proposed defences.
